

Pipe Sealer Kit is a light and rapid tool for stopping high-pressure leakages in pipes. It is quick and easy to operate:

1. Fit the strap loosely around the pipe next to the leak
2. Pull it sideways so that the rubber patch covers the leak
3. Tighten the ratchet until the leak stops

The kit contains different sizes of straps and rubber patches for a wide range of pipe dimensions.

Pipe Sealer Kit combined with the Tank Sealer Kit serves as a comprehensive preparedness tool for oil spill prevention at any tank farm or processing plant.

DETAILS

Contents
